

Not Your ^{Great} Grandfather's Clay Pipe

Clay is still the longest lasting, best value product for gravity sanitary sewers. It has always been chemically inert and environmentally friendly.

Have you looked into the advantages clay pipe could provide to your system?

The National Clay Pipe Institute (NCPI) is a non-profit technical resource for design, installation and operation of vitrified clay pipe (VCP) gravity sewer systems. For more information visit our website or call to schedule a visit with an NCPI representative.

coming this Spring***

Do you know what's new about clay pipe?

Greater Strength & Durability – Better raw materials and more precise manufacturing controls all result in even stronger and more durable pipe.

Leak-free, factory applied joints – Clay pipe joints are now factory applied, so whether it's bell & spigot pipe for open cut trench or a low-profile pipe for trenchless applications, compression joints ensure even better performance than the 100-year old pipe that is still in service.

Design Options – How engineers use our pipe has changed. So whether using it with CLSM at extreme depths, in trenchless applications or in an open trench, clay pipe provides greater design options.
